ORACLE
ACE Director

@YourNavionPilot

**Information Security is like teenage sex
Everyone is talking about it
Everybody thinks everyone is doing it
And those that are doing it, are doing it badly.**

Anything can be hacked

Who am I

ORACLE
ACE Director

Important Terms

SQL Injection: Change a sql statement so it executes code that was not intended. Think “Change the code execution path.”

Hack: Anything can be hacked. Do something it was not intended to do or something you did not think it could do.

Attack Surface: Any node on the network can be attacked. That can be the UI, People, anything that touches data.

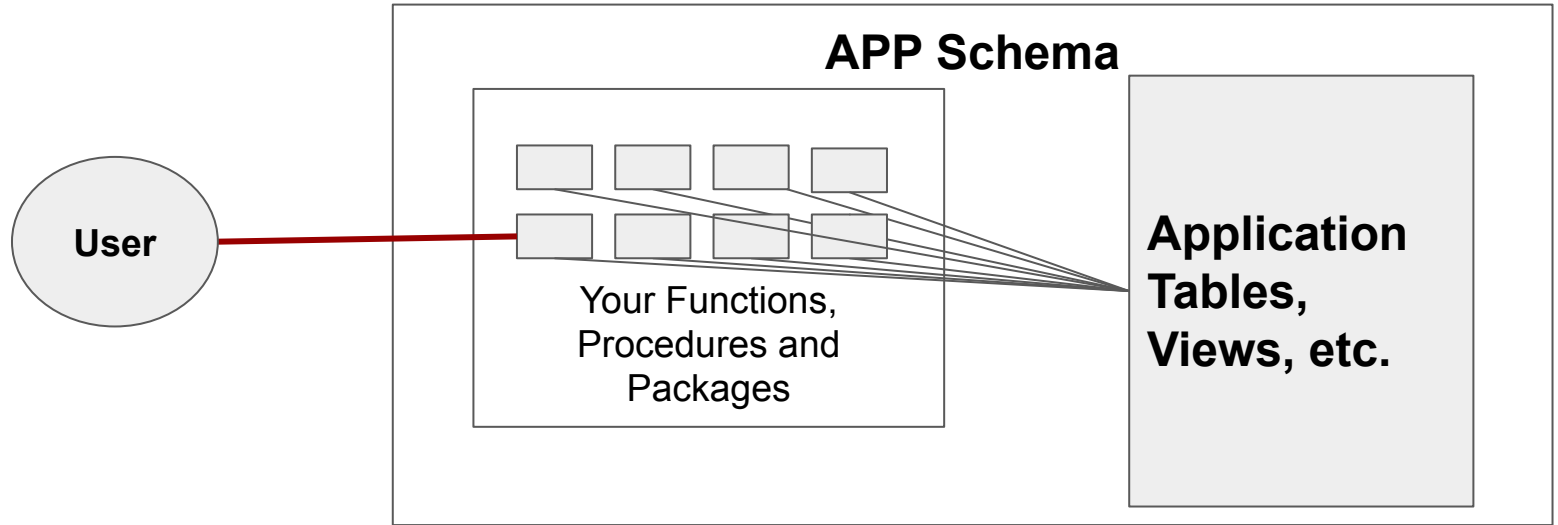

Exploit: Take advantage of a flaw or feature

Spill: When data leaves it's protected environment. It may or may not be compromised

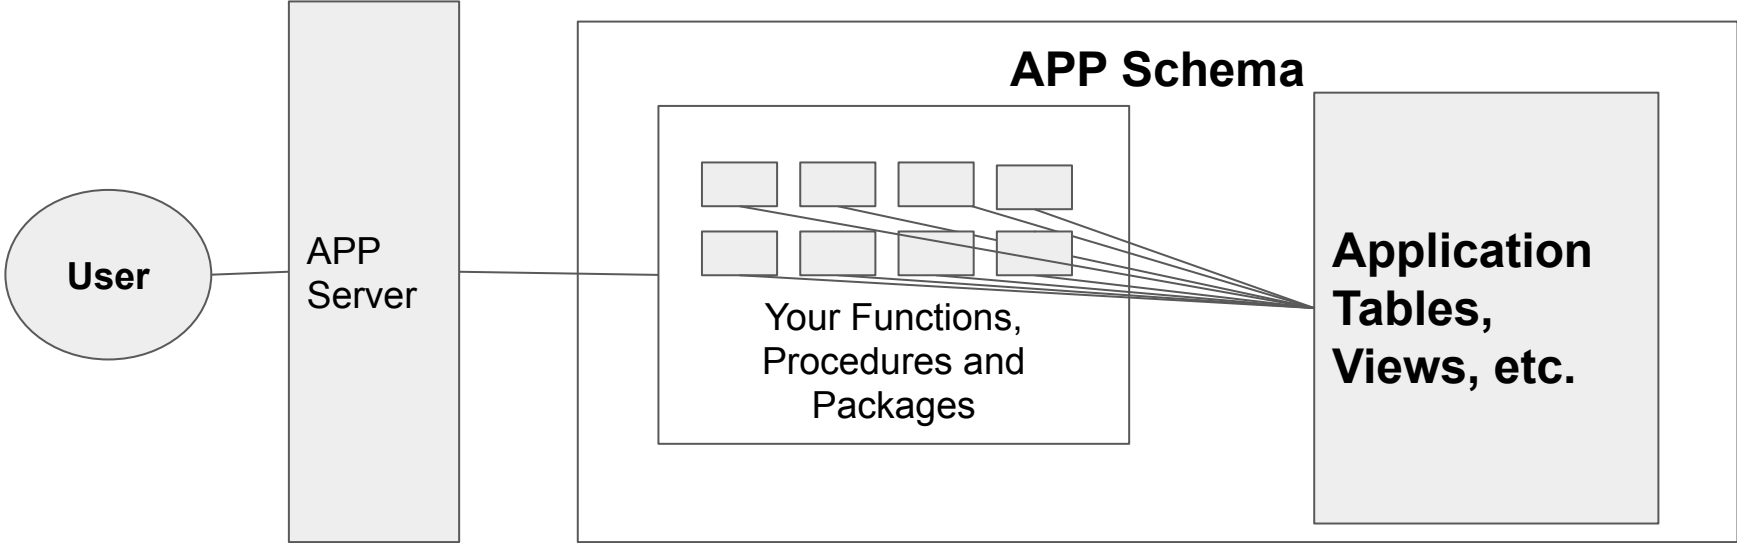

Leak: Data has left it's protected environment and has been compromised.

Everywhere I go.

Everywhere I go.

SQL Injection

SQL Injection Demo

Create a procedure that is full of sql injection bugs.

- concatenate strings into a sql statement.

SQL Injection Demo

```
oracle@localhost:~/demo/sql_injection
- Connect as HR in at least 10.2 before running this SQL*Plus script.
SET ECHO ON
SET SERVEROUTPUT ON

CREATE OR REPLACE
PROCEDURE show_col (p_colname varchar2, p_tablename  varchar2)
AS
type t is varray(200) of varchar2(4000);
Results t;

    Stmt CONSTANT VARCHAR2(4000) :=
        'SELECT '|| p_colname || ' FROM '|| p_tablename;

BEGIN
    DBMS_Output.Put_Line ('SQL Stmt: ' || Stmt);
    EXECUTE IMMEDIATE Stmt bulk collect into Results;
    for j in 1..Results.Count() loop
    DBMS_Output.Put_Line(Results(j));
    end loop;
EXCEPTION WHEN OTHERS THEN
    dbms_output.put_line(stmt || ' ' || sqlerrm);
    Raise_Application_Error(-20000, 'Wrong table name');
END show_col;
/

pause
execute show_col('Email','EMPLOYEES');
pause
execute show_col('Email','EMPLOYEES where rownum < 10');
pause
execute show_col('Email','EMPLOYEES where 1=2 union select Username c1 from All_Users --');
pause
EMPLOYEES where 1=2 union select name, type from user_source --');
EMPLOYEES where 1=2 union select name from user_source --');

1,1 Top
```

PL/SQL Secure Coding SQL Injection, extracting your source code

Not only am I getting your source code, I'm also getting all of your comments.

Demo - Extract from all_tables

Demo - Extract from all_source

Demo - Extract Packages

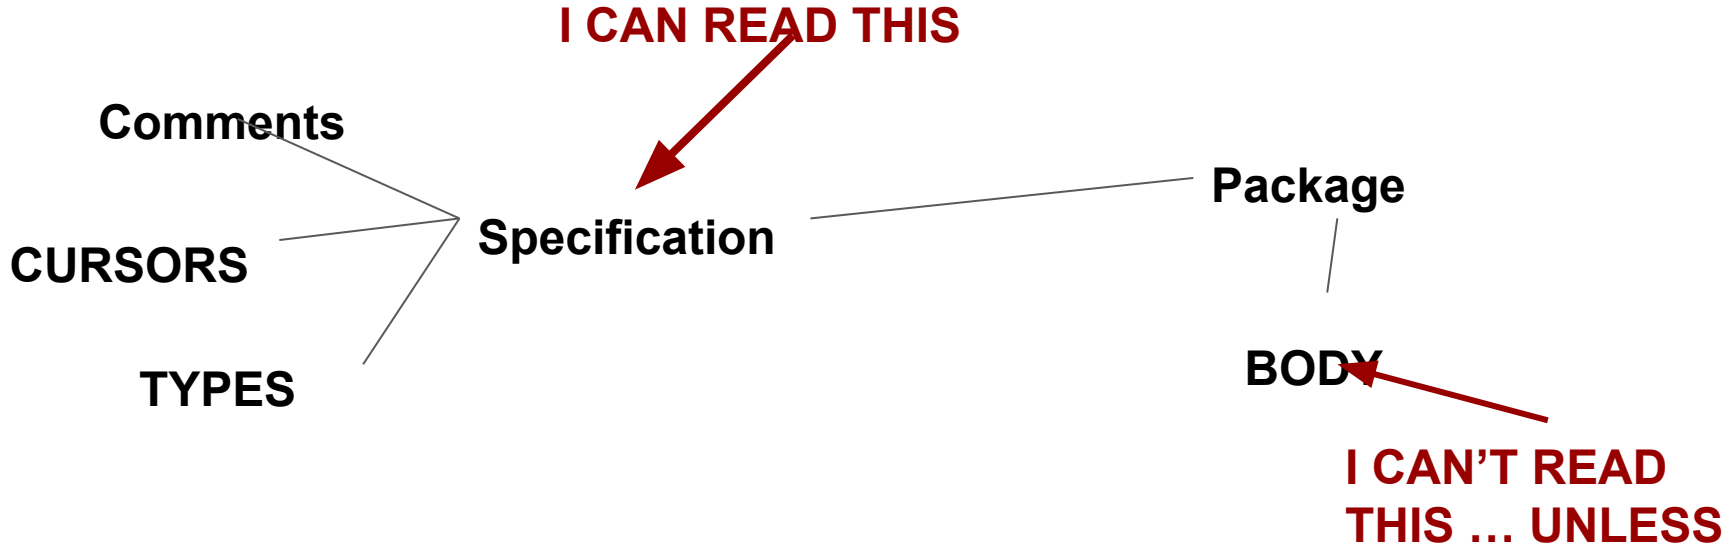

PL/SQL Secure Coding SQL Injection, extracting your source code

Not only am I getting your source code, I'm also getting all of your comments.

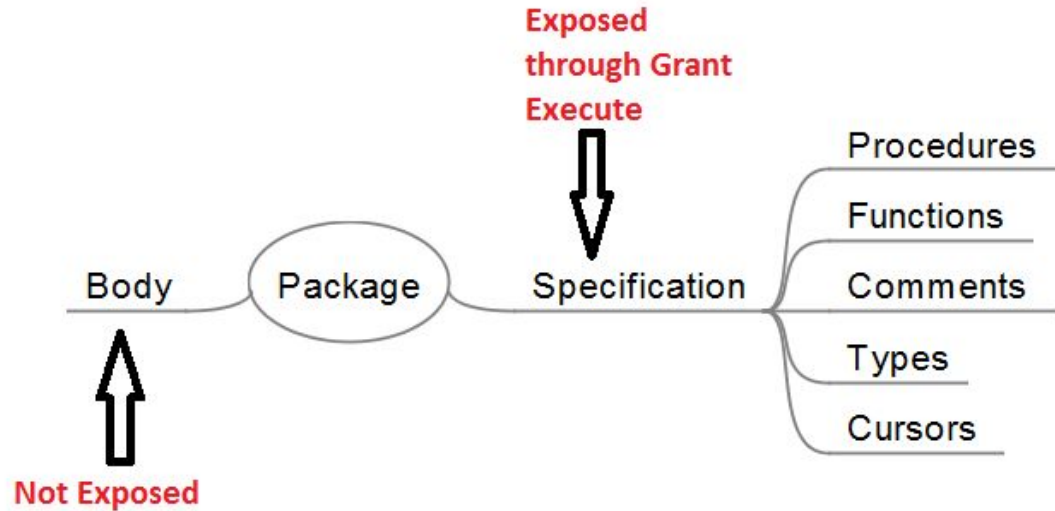

- we are only getting the package specification.
- we still have copious comments in the package specification. I can use those comments to derive how your package works.
- we have cursor and type definitions in the package specification. Do you really need to have those in the specification? Sometime the answer is going to be yes, other times no. I always weight the moving cursors and type definitions to the package body, then go through the thought process to justify moving into the specification.

Packages

Packages

Packages

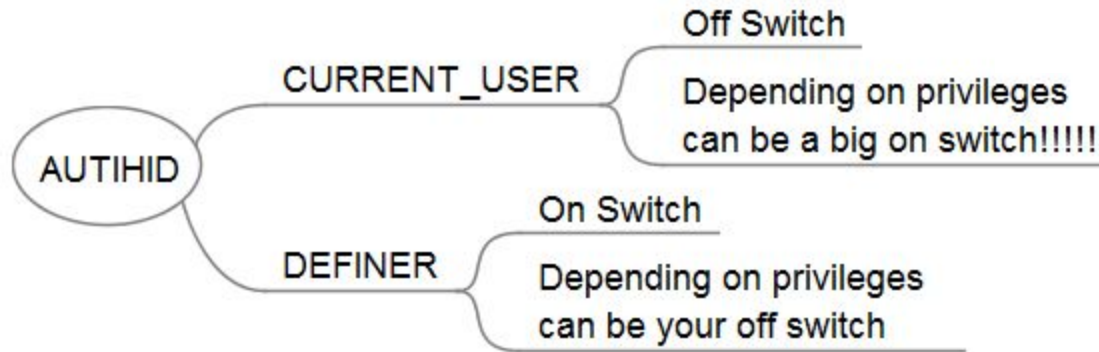

This comment is great
BUT it still gives the bad
guys too much
information

```
84
85 create or replace PACKAGE INMS_APP.REPORTTARGET
86 AUTHID current_user
87 --ACCESSABLE BY (INMS_APP.IRP_READPRISMFILES) → → → -- this is a version 12c feature. implement when move to 12c.
88 AS
89 → -- constant delorations
90 → lVersion → CONSTANT VARCHAR2(10) := '20161026.1';
91
92 → FUNCTION MAIN RETURN NUMBER;
93 → FUNCTION WHAT_VERSION RETURN VARCHAR2;
94
95 END REPORTTARGET;
96 /
```

IS AUTHID CURRENT_USER A GOOD IDEA?

What happens with authid current_user is abused?
revoke inherit privileges on user <USER> from public;

Schema Only account

Connect by proxy

```
create user <username> no authentication
```

```
grant create session, create procedure,  
create table to <username>;
```

```
alter user <username> grant connect  
through <app_dba_account>;
```

```
conn rlockard[test_data1]@orclpdb1
```

INHERIT PRIVILEGES

Packages - SQL Injection

Specification

I CAN READ THIS

Comments

CURSORS

TYPES

Package

BODY

I CAN'T READ
THIS ... UNLESS

Procedures / Functions - SQL Injection

I CAN READ
EVERYTHING

PROCEDURE / FUNCTION

COMMENTS
CURSORS
CODE

Packages - SQL Injection

```
84
85 create or replace PACKAGE INMS_APP.REPORTTARGET
86 AUTHID current_user
87 --ACCESSIBLE BY: (INMS_APP.IRP_READPRISMFILES) → → → → -- this is a version 12c feature. implement when move to 12c.
88 AS
89 → -- constant delorations
90 → lVersion → CONSTANT VARCHAR2(10) := '20161026.1';
91
92 → FUNCTION MAIN RETURN NUMBER;
93 → FUNCTION WHAT_VERSION RETURN VARCHAR2;
94
95 END REPORTTARGET;
96 /
```

SYNONYMS

USE SYS.DBMS_OUTPUT

Limit the number of ways to get to your data. Trusted Path. The wrong way to do it.

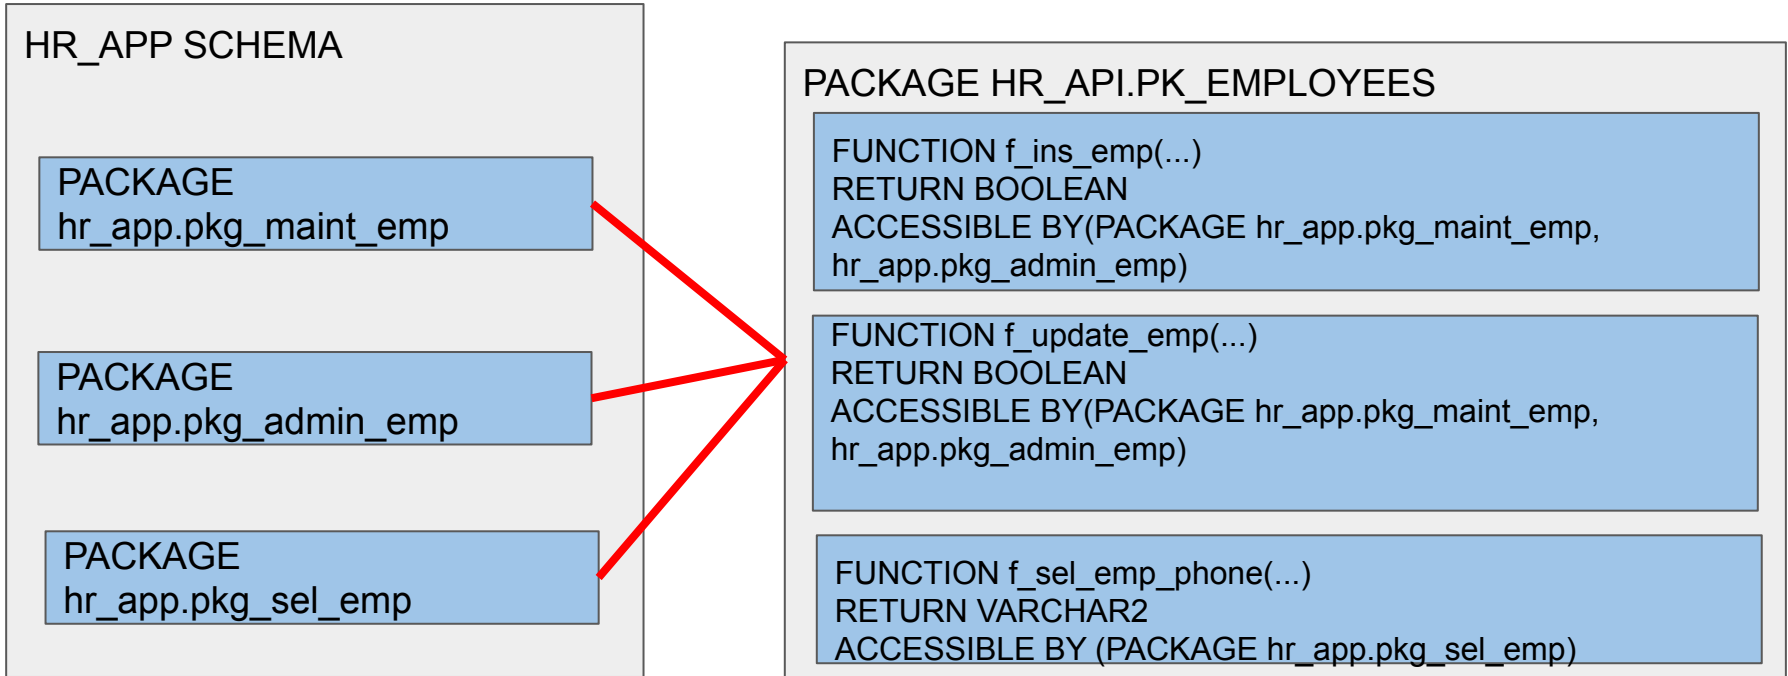

```
005 CREATE OR REPLACE PROCEDURE process_one_row (table_in IN VARCHAR2,  
006 where_in IN VARCHAR2)  
007  
008 l_block VARCHAR2 (32767)  
009 := 'DECLARE l_row '  
010 || table_in  
011 || '%ROWTYPE; BEGIN SELECT * INTO l_row FROM '  
012 || table_in  
013 || ' WHERE '  
014 || where_in  
015 || '; /* Then do stuff with that row... */'  
016 || ' END;';  
017 BEGIN  
018  
019 DBMS_OUTPUT.put_line (l_block);  
020  
021 EXECUTE IMMEDIATE l_block;  
022 EXCEPTION
```

Because authId
not specified
the procedure
is created with
definer rights

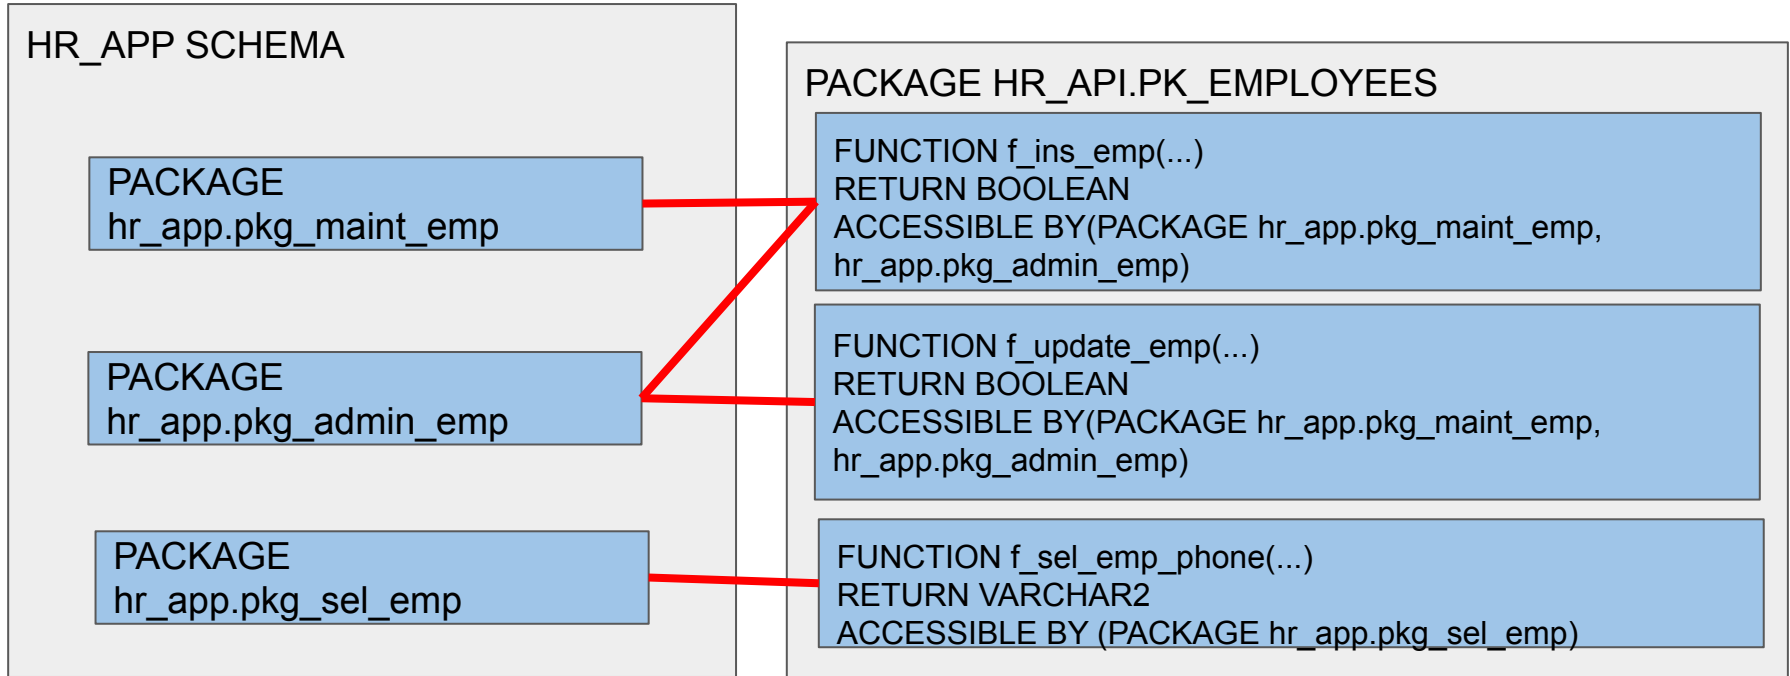

Because this is a
procedure a hacker
can extract your code.

Huge SQL
Injection Bug

ACCESSIBLE BY 12.1

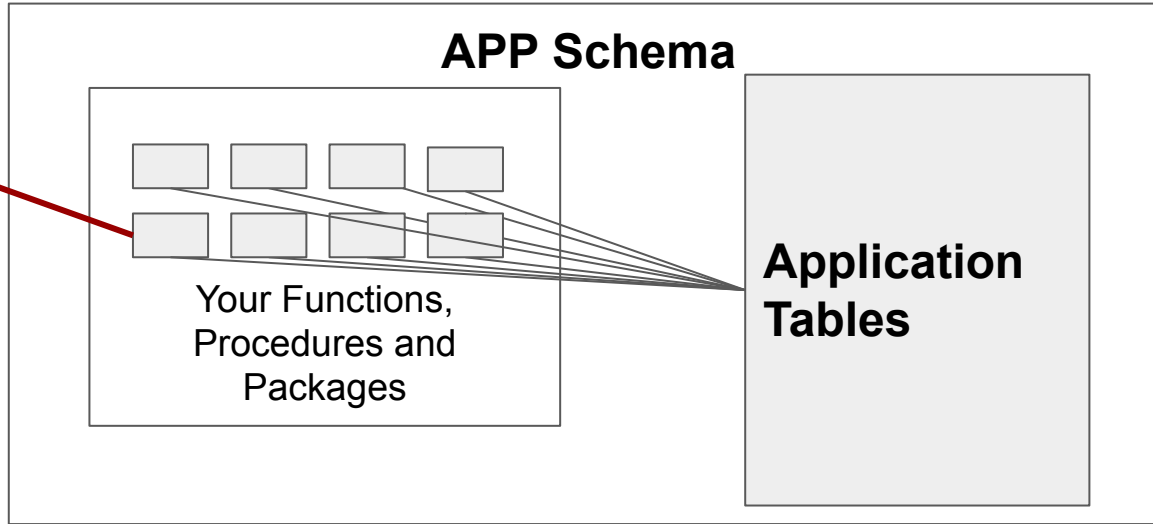

ACCESSIBLE BY 12.2 ENHANCEMENTS

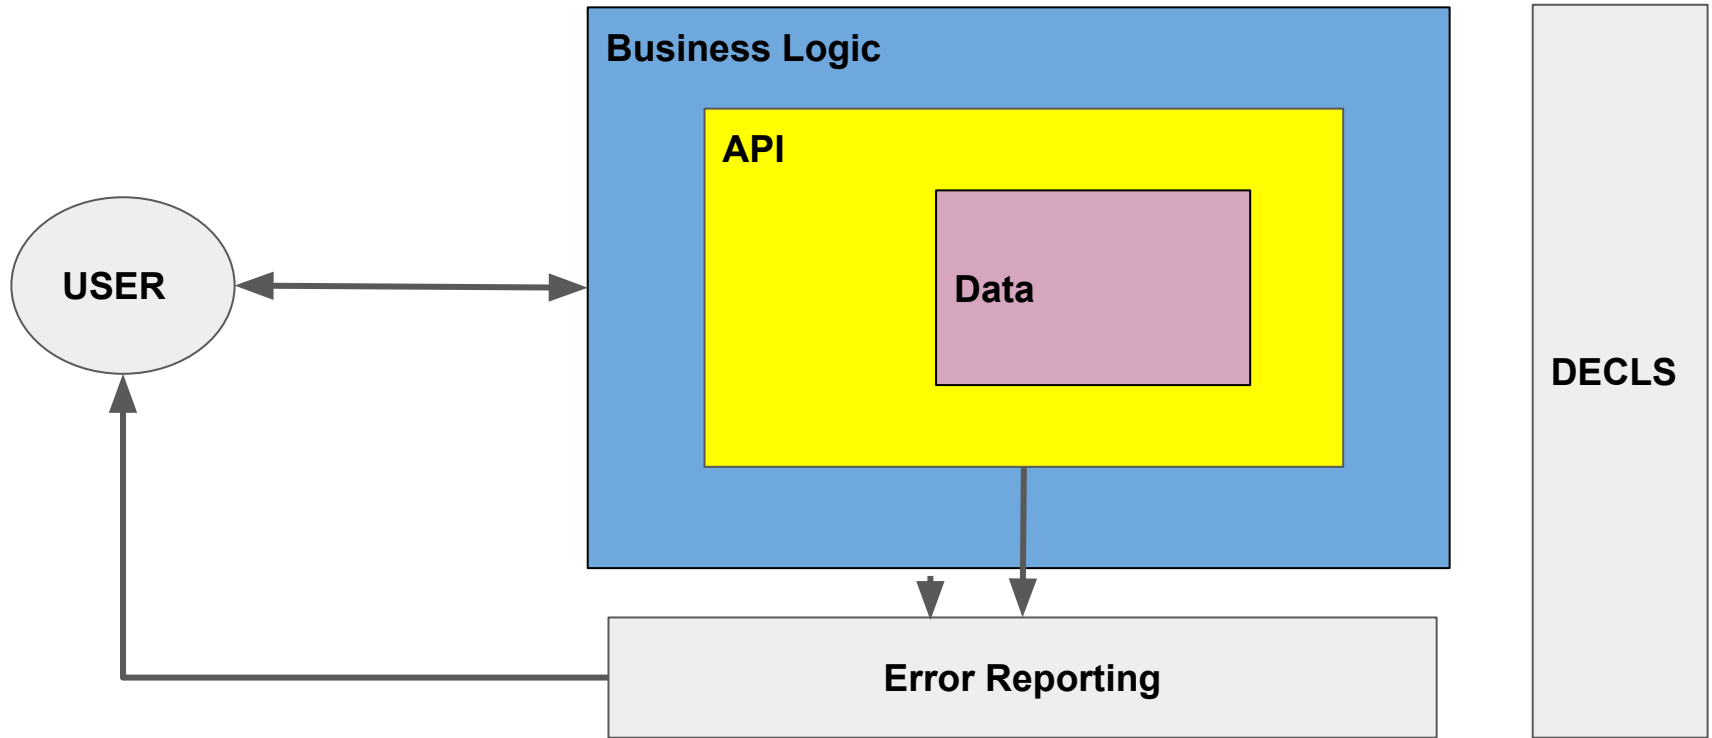

Limit the number of ways to get to your data. Trusted Path. The wrong way to do it.

All I need is one sql injection bug and I own the database

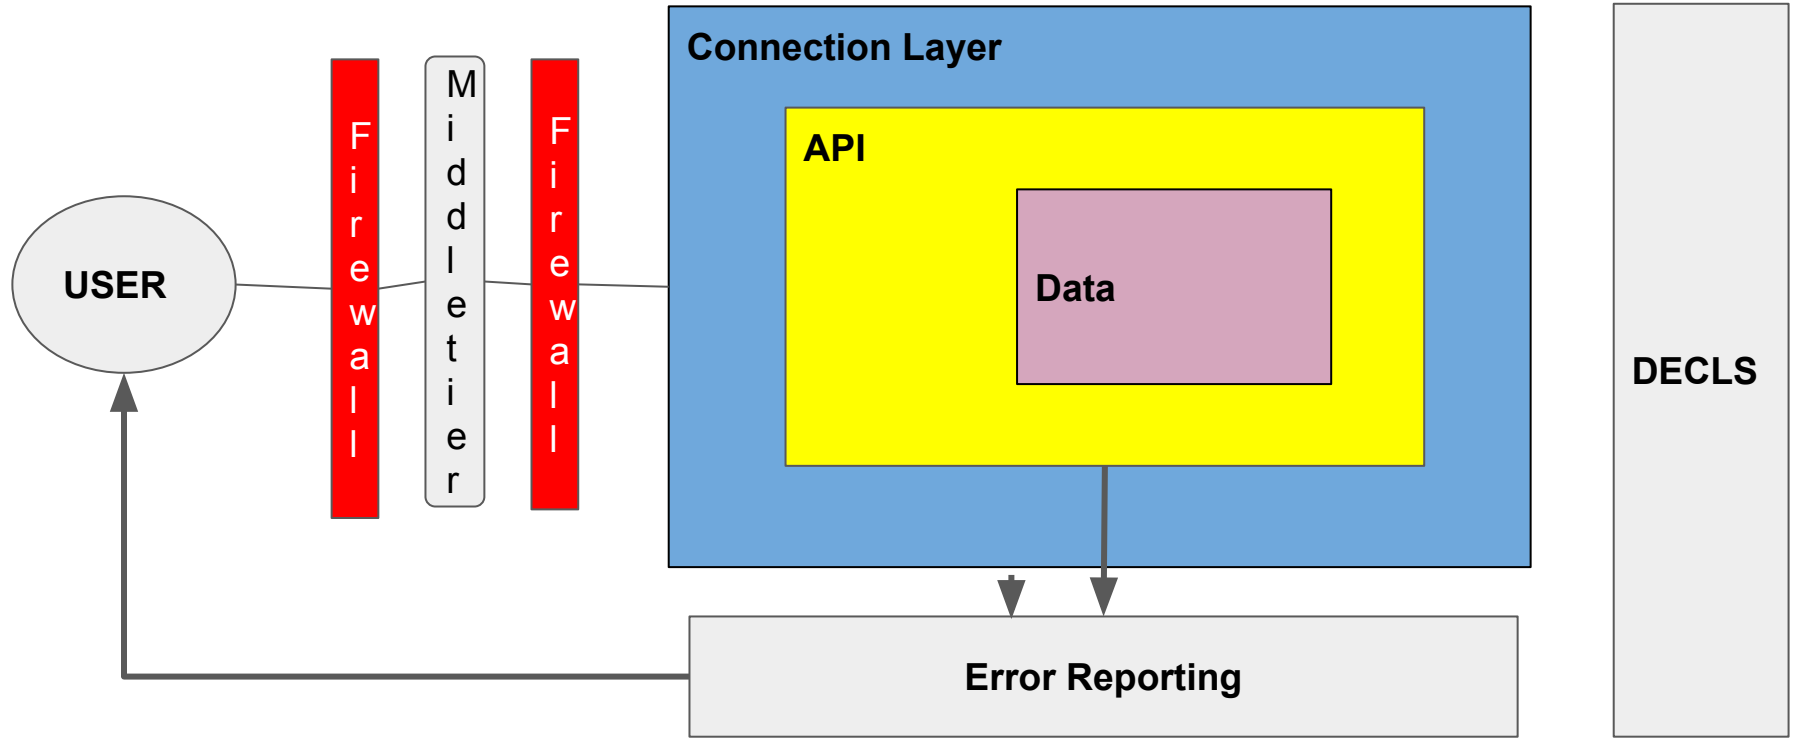

Secure Architecture 1

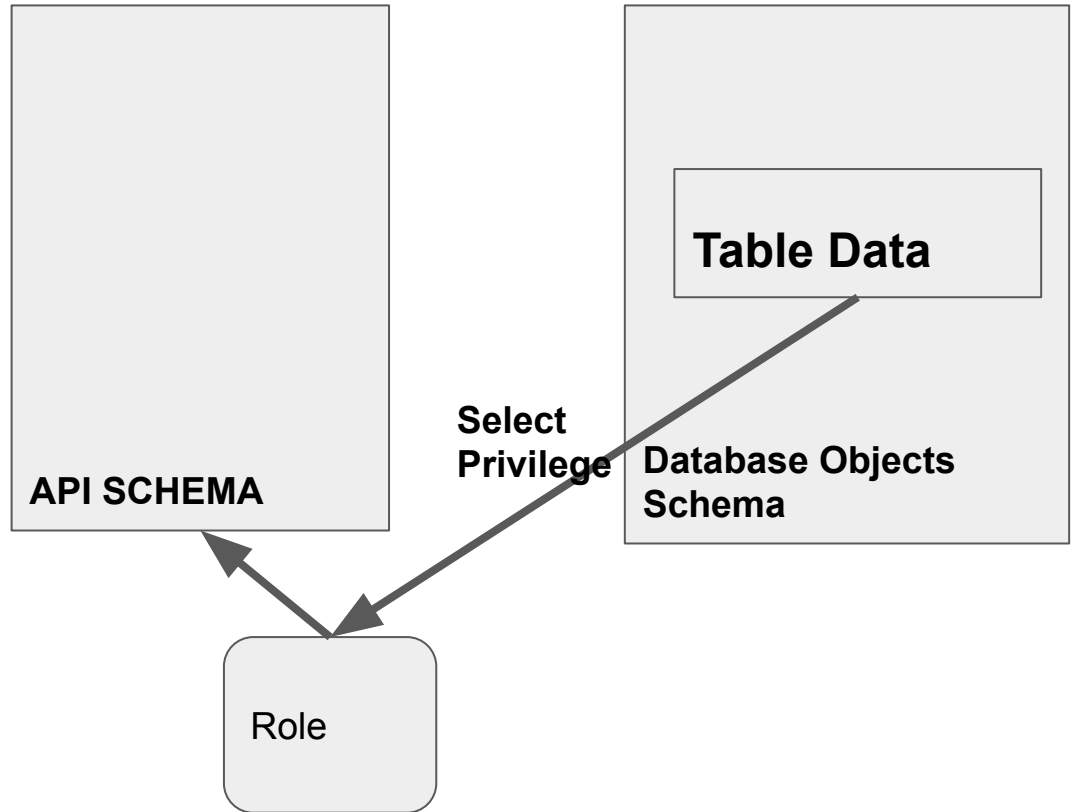

Based on the original work of Bryn Llewellyn

Secure Architecture 2

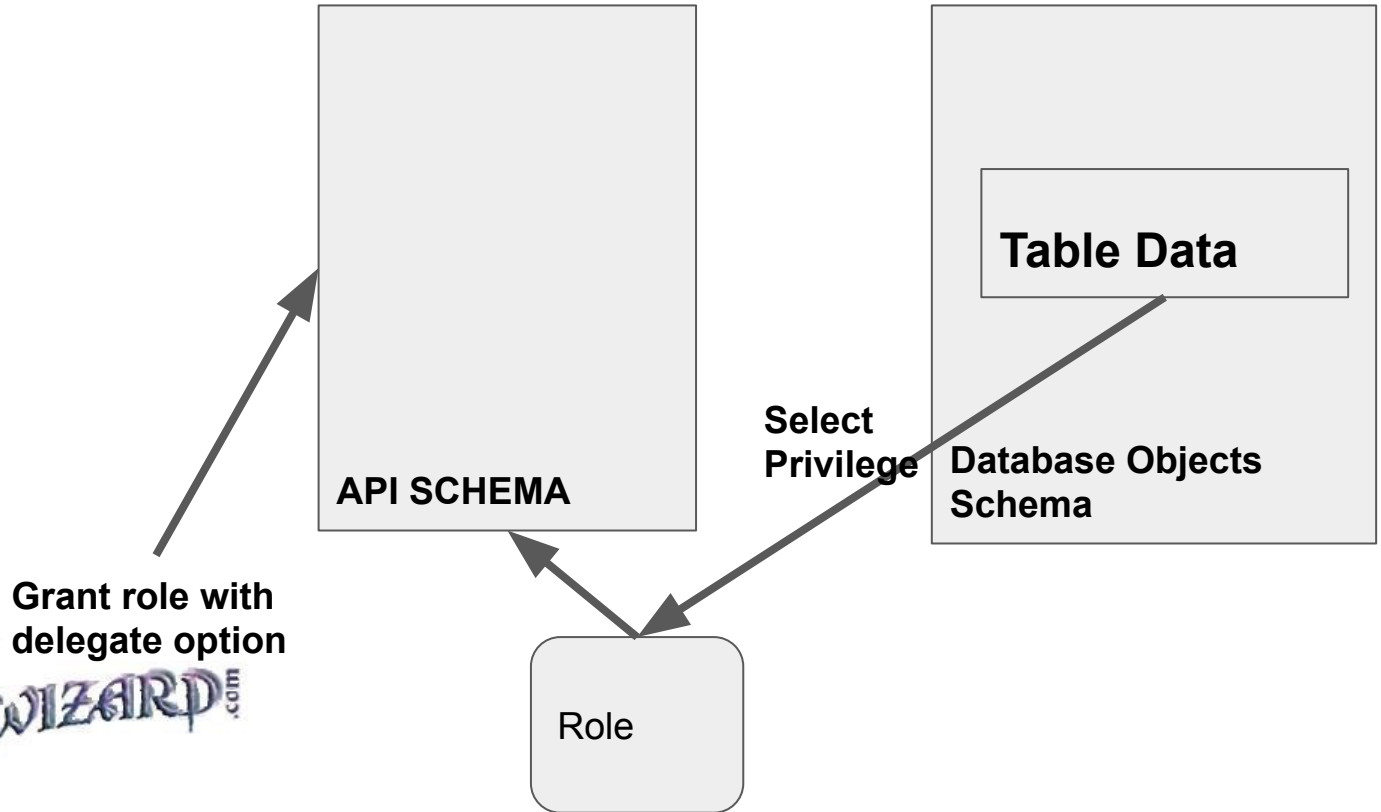

Based on the original work of Bryn Llewellyn

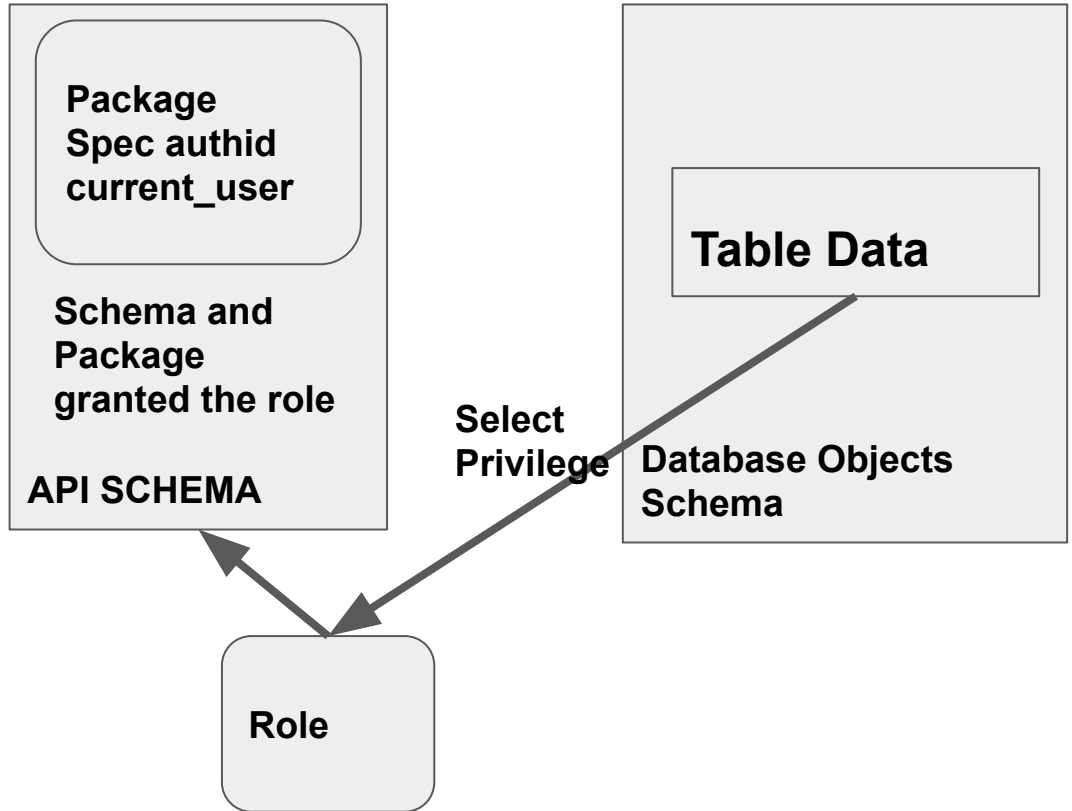

Code Based Access Control

Code Based Access Control

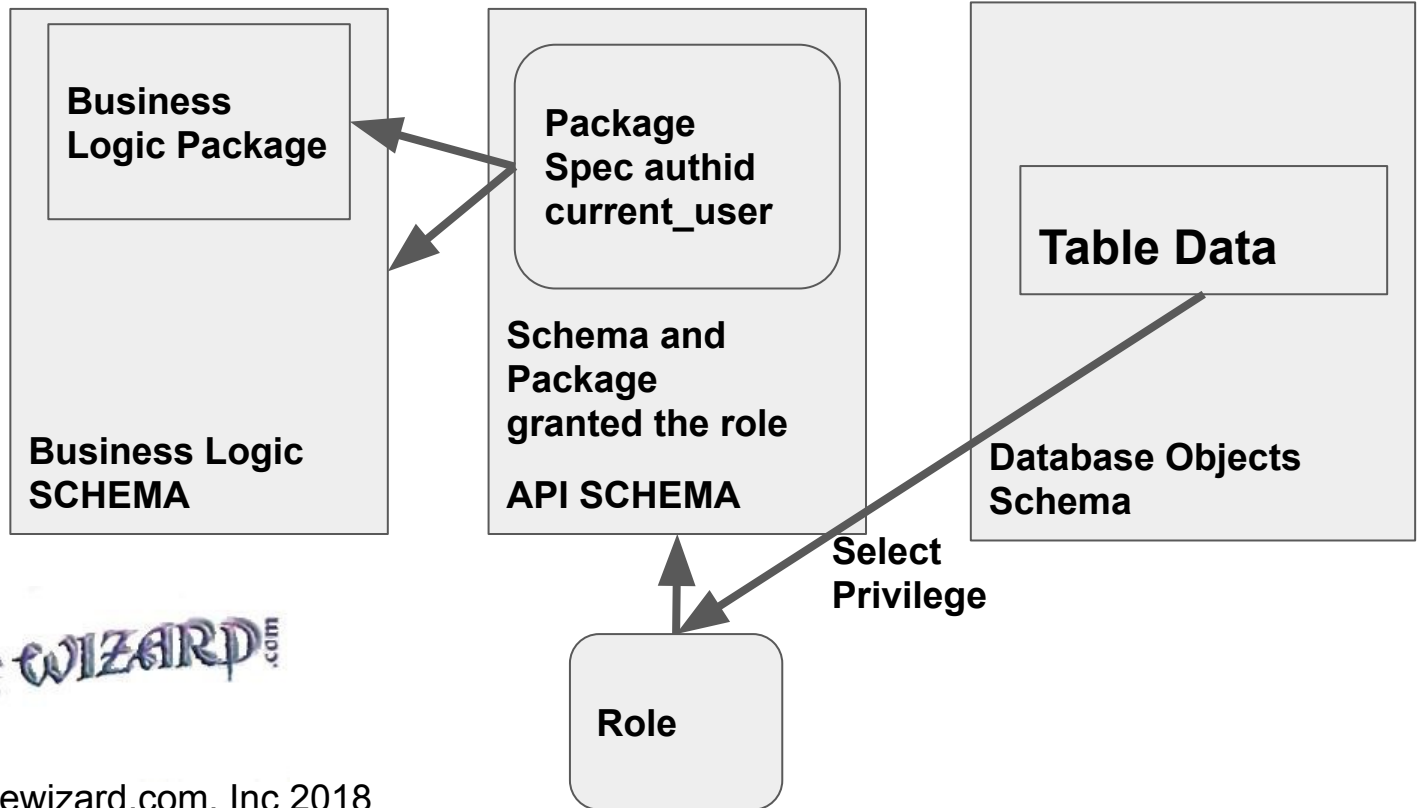

Code Based Access Control

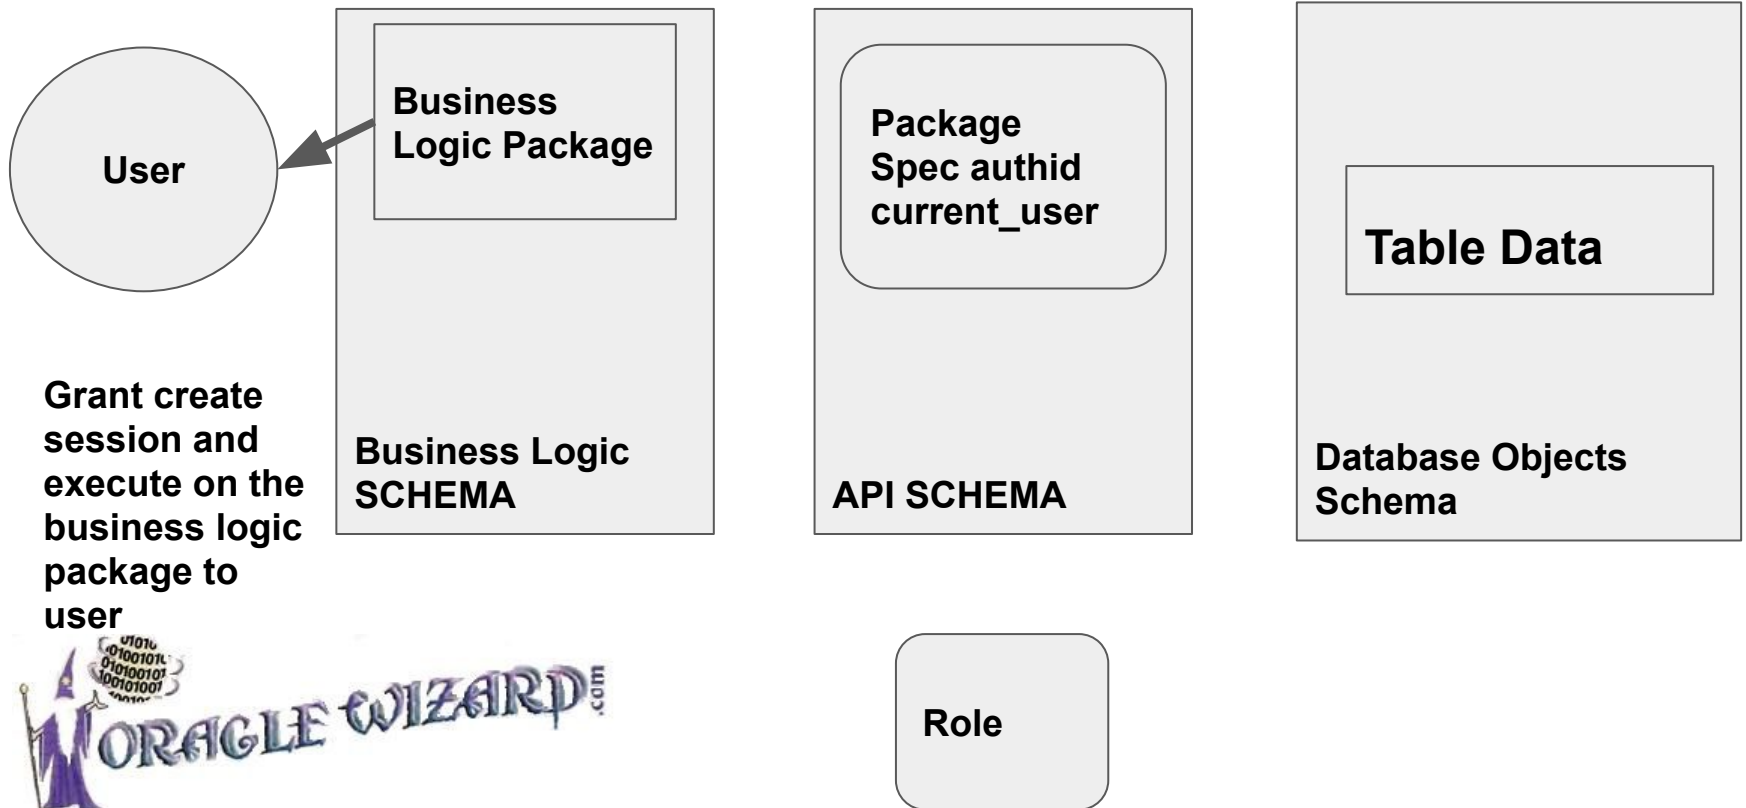

Code Based Access Control

Grant execute on package to Business logic shema and accessible by to the business logic package.procedure

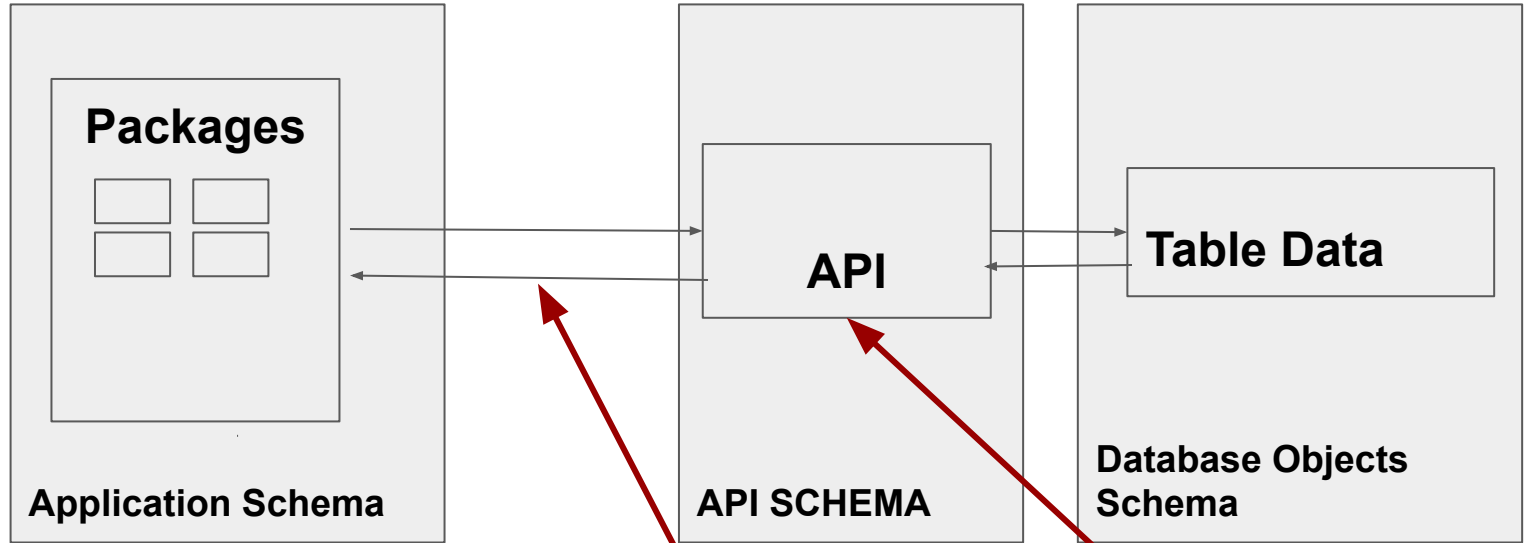

Code Based Access Control

Grant create
session and
execute on the
business logic
package to
user

Limit the number of ways to get to your sensitive data. Trusted Path

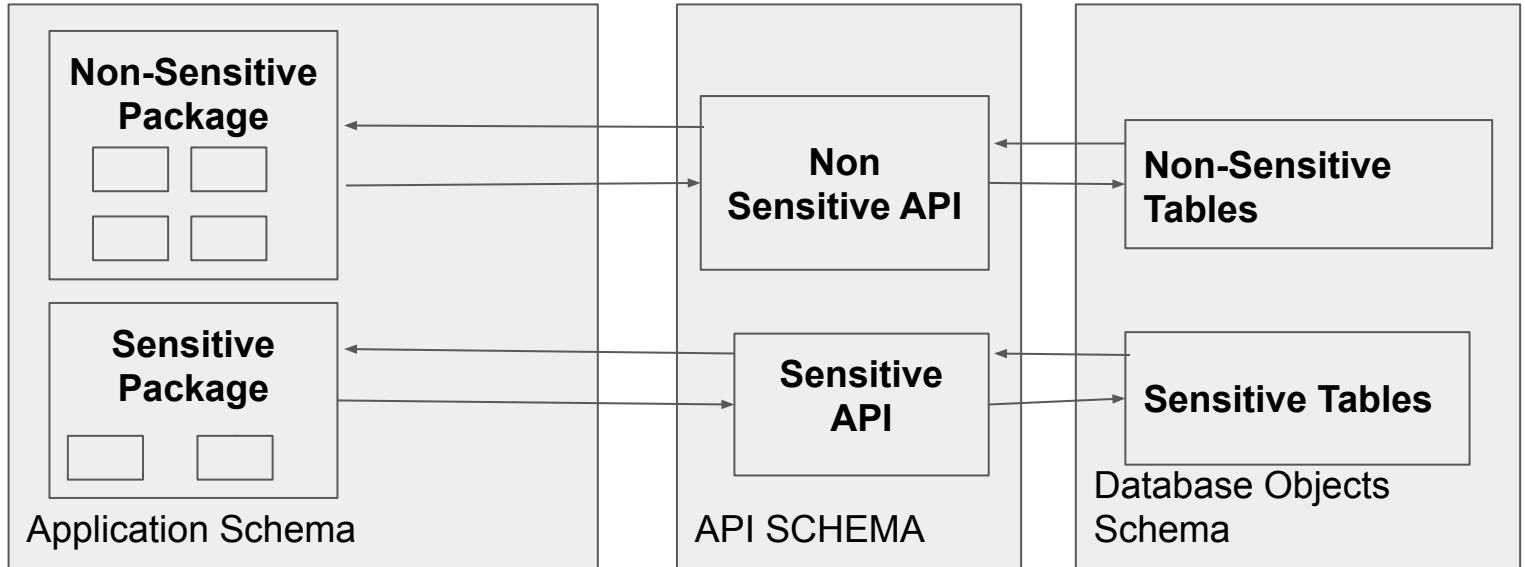

Use Accessible By Clause

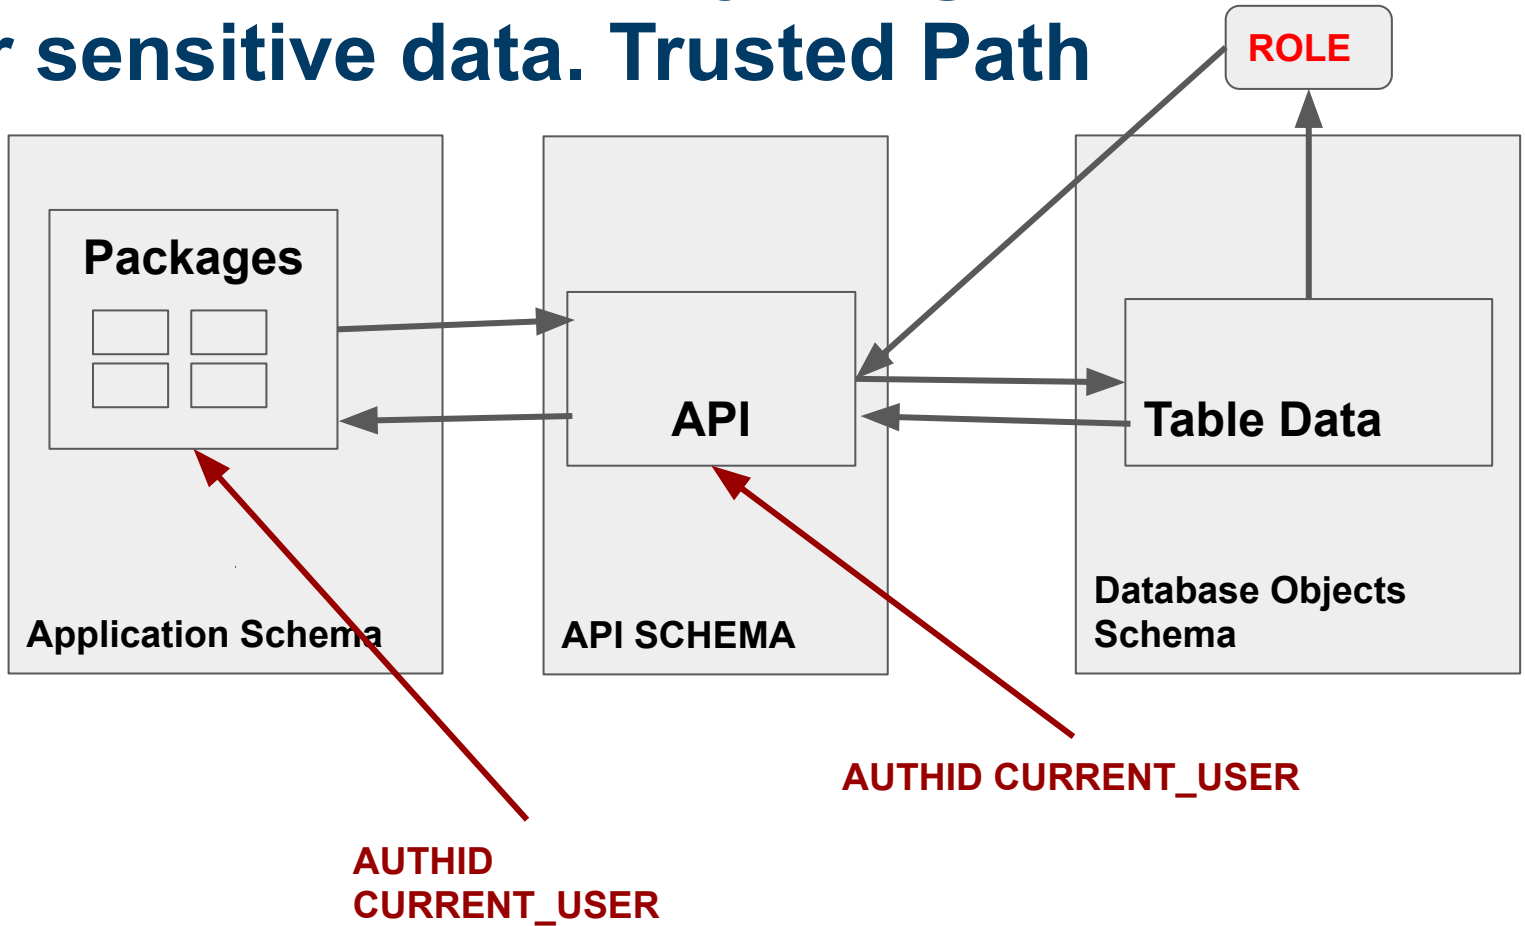

Use Strongly Typed API

Split sensitive and non sensitive packages

Limit the number of ways to get to your sensitive data. Trusted Path

Code Based Access Control

Error Messages

```
EXCEPTION WHEN OTHERS THEN
  error_log.errorstack_pkg.pMain(pErrorId => iErrorId);
  raise_application_error(-20000, 'An error was raised, check log # ' || iErrorId);
END;
```

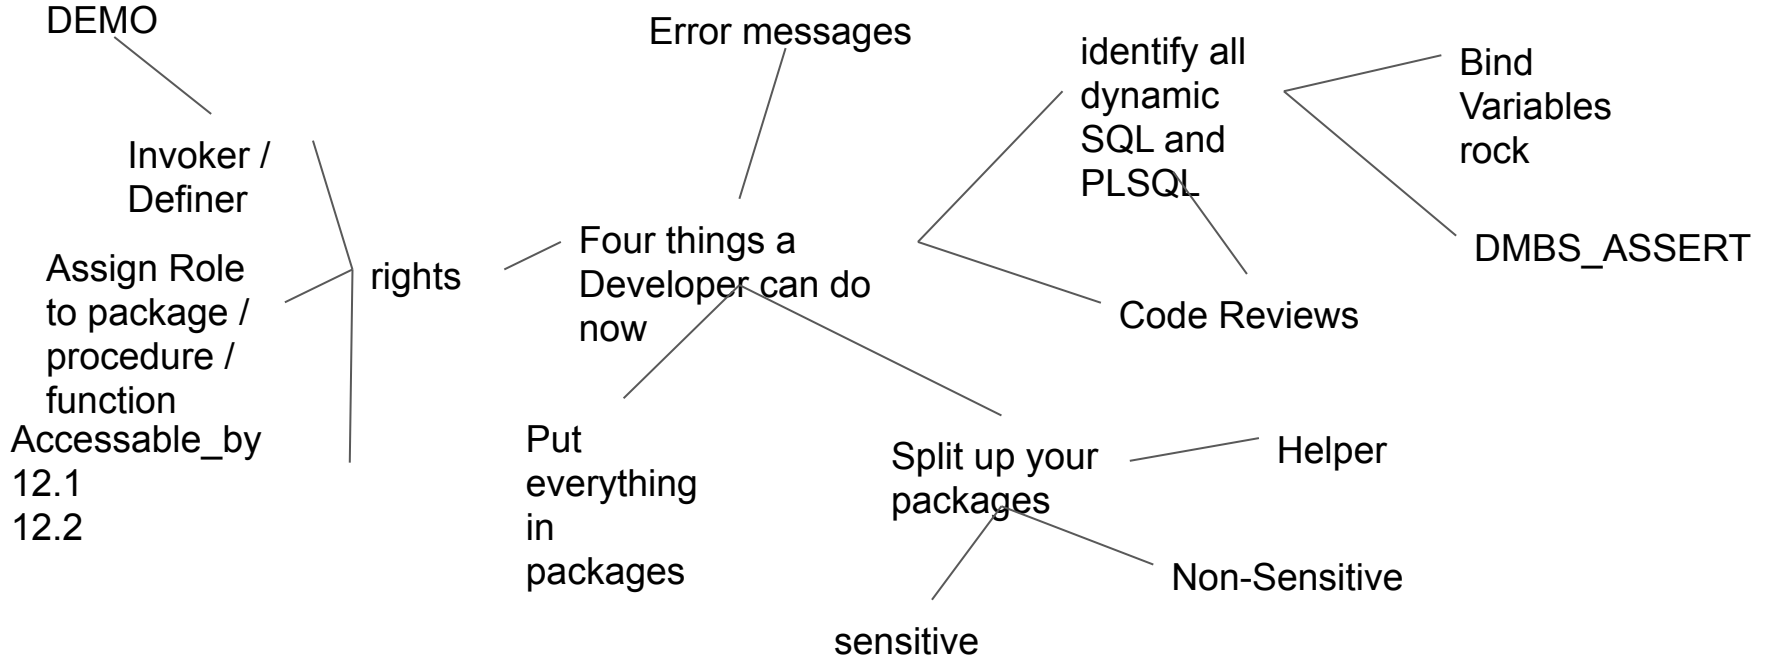

**Putting it
all together**

**Oh Demo gods, please
let this work. :-)**

4 things developers can do now to improve security... in process

Oooopsy, I lied, there are more than 4 things. :-)
